

*Brewer LiftMate™ Patient Lift*

## Advance throughput & safety with LiftMate™.

Whether you are looking at diagnosis or treatment, oncology patients can pose unique patient-handling challenges. They tend to be in a weakened state and often require numerous scans and radiation treatments as part of their care protocol. This combination, along with the narrow table designs

of so many imaging and radiation devices, can put patients at greater risk of injury due to falls. Yet, you still want to maximize throughput without compromising the safety of patients or staff. Now, you can with a cost-effective, patient-handling breakthrough – LiftMate.

- **Safely & efficiently handle more challenging patients** – Quickly & effortlessly get patients up onto and off of narrow imaging and radiation tables.
- **Reduce the risk of patient injury due to falls** – Floor-level access, a sturdy platform and handrails on both sides help assure confident patient transitions.
- **Lower the risk of injury to staff** – Push-button activation minimizes technician interaction, helping prevent nagging, lifting-related injuries that can lead to missed days of work or costly worker compensation claims.
- **Cost-effectively support multiple imaging and radiation suites with a single LiftMate** – Mobile and maneuverable design makes it easy to move LiftMate from one room to another.
